## NCERT Solutions for 11th Class Chemistry: Chapter 1-Some Basic Concepts

Class 11: Chemistry Chapter 1 solutions. Complete Class 11 Chemistry  
Chapter 1 Notes.

### NCERT Solutions for 11th Class Chemistry: Chapter 1-Some Basic Concepts

NCERT 11th Chemistry Chapter 1, class 11 Chemistry Chapter 1 solutions

Page No: 22

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

## Exercises

1.1. Calculate the molecular mass of the following :

(i)  $\text{H}_2\text{O}$  (ii)  $\text{CO}_2$  (iii)  $\text{CH}_4$

### Answer

(i)  $\text{H}_2\text{O} = (2 \times \text{Atomic mass of H}) + (1 \times \text{Atomic mass of O})$

$$= [2(1.0084) + 1(16.00)] \text{ amu} = 2.016 \text{ u} + 16.00 \text{ amu} = 18.016 \text{ amu}$$

(ii)  $\text{CO}_2 = (1 \times \text{Atomic mass of C}) + (2 \times \text{Atomic mass of O})$

$$= [1(12.011) + 2(16.00)] \text{ amu} = 12.011 \text{ amu} + 32.00 \text{ u} = 44.01 \text{ amu}$$

(iii)  $\text{CH}_4 = (1 \times \text{Atomic mass of carbon}) + (4 \times \text{Atomic mass of hydrogen})$

$$= [1(12.011) + 4(1.008)] \text{ amu} = 12.011 \text{ amu} + 4.032 \text{ amu} = 16.043 \text{ amu}$$

1.2. Calculate the mass percent of different elements present in Sodium Sulphate ( $\text{Na}_2\text{SO}_4$ ).

### Answer

Molar mass of  $\text{Na}_2\text{SO}_4 = [(2 \times 23.0) + (32.00) + 4(16.00)] = 142 \text{ g}$

Mass percent of an element = (Mass of that element in compound/Molar mass of that compound)  $\times 100$

$$\therefore \text{Mass percent of sodium (Na): } (46/142) \times 100 = 32.39\%$$

$$\text{Mass percent of sulphur(S): } (32/142) \times 100 = 22.54\%$$

$$\text{Mass percent of oxygen:(O): } (64/142) \times 100 = 45.07\%$$

NCERT 11th Chemistry Chapter 1, class 11 Chemistry Chapter 1 solutions

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

**1.3. Determine the empirical formula of an oxide of iron which has 69.9% iron and 30.1% dioxygen by mass.**

**Answer**

% of iron by mass = 69.9 % [Given]

% of oxygen by mass = 30.1 % [Given]

Atomic mass of iron = 55.85 amu

Atomic mass of oxygen = 16.00 amu

Relative moles of iron in iron oxide = %mass of iron by mass/Atomic mass of iron =  $69.9/55.85 = 1.25$

Relative moles of oxygen in iron oxide = %mass of oxygen by mass/Atomic mass of oxygen =  $30.01/16=1.88$

Simplest molar ratio =  $1.25/1.25 : 1.88/1.25$

$\Rightarrow 1 : 1.5 = 2 : 3$

$\therefore$  The empirical formula of the iron oxide is  $\text{Fe}_2\text{O}_3$ .

**1.4. Calculate the amount of carbon dioxide that could be produced when**

**(i) 1 mole of carbon is burnt in air.**

**(ii) 1 mole of carbon is burnt in 16 g of dioxygen.**

**(iii) 2 moles of carbon are burnt in 16 g of dioxygen.**

**Answer**

The balanced reaction of combustion of carbon in oxygen is:

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basics-concepts/>

1mole    1mole(32g)    1mole(44g)

(i) In dioxygen, combustion is complete. Therefore 1 mole of carbon dioxide produced by burning 1 mole of carbon.

(ii) Here, oxygen acts as a limiting reagent as only 16 g of dioxygen is available. Hence, it will react with 0.5 mole of carbon to give 22 g of carbon dioxide.

(iii) Here again oxygen acts as a limiting reagent as only 16 g of dioxygen is available. It is a limiting reactant. Thus, 16 g of dioxygen can combine with only 0.5 mole of carbon to give 22 g of carbon dioxide.

NCERT 11th Chemistry Chapter 1, class 11 Chemistry Chapter 1 solutions

**1.5. Calculate the mass of sodium acetate ( $\text{CH}_3\text{COONa}$ ) required to make 500 mL of 0.375 molar aqueous solution. Molar mass of sodium acetate is  $82.0245\text{g mol}^{-1}$ .**

**Answer**

0.375 M aqueous solution of sodium acetate means that 1000 mL of solution containing 0.375 moles of sodium acetate.

$$\therefore \text{No. of moles of sodium acetate in 500 mL} = (0.375/1000) \times 500 = 0.375/2 = 0.1875$$

$$\text{Molar mass of sodium acetate} = 82.0245\text{g mol}^{-1}$$

$$\therefore \text{Mass of sodium acetate acquired} = 0.1875 \times 82.0245\text{ g} = 15.380\text{g}$$

**1.6. Calculate the concentration of nitric acid in moles per litre in a sample which has a density,  $1.41\text{ g mL}^{-1}$  and the mass per cent of nitric acid in it being 69%.**

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

## Answer

Mass percent of 69% means that 100g of nitric acid solution contain 69 g of nitric acid by mass.

Molar mass of nitric acid ( $\text{HNO}_3$ ) =  $1+14+48 = 63 \text{ g mol}^{-1}$

Number of moles in 69 g of  $\text{HNO}_3 = 69/63 \text{ moles} = 1.095 \text{ moles}$

Volume of 100g nitric acid solution =  $100/1.41 \text{ mL} = 70.92 \text{ mL} = 0.07092 \text{ L}$

$\therefore$  Conc. of  $\text{HNO}_3$  in moles per litre =  $1.095/0.07092 = 15.44 \text{ M}$

### **1.7. How much copper can be obtained from 100 g of copper sulphate ( $\text{CuSO}_4$ )?**

#### Answer

1 mole of  $\text{CuSO}_4$  contains 1 mole of copper.

Molar mass of  $\text{CuSO}_4 = (63.5) + (32.00) + 4(16.00)$

$= 63.5 + 32.00 + 64.00 = 159.5 \text{ g}$

159.5 g of  $\text{CuSO}_4$  contains 63.5 g of copper.

$\therefore$  copper can be obtained from 100 g of copper sulphate =  $(63.5/159.5) \times 100 = 39.81 \text{ g}$

### **1.8. Determine the molecular formula of an oxide of iron in which the mass per cent of iron and oxygen are 69.9 and 30.1 respectively. Given that the molar mass of the oxide is $159.69 \text{ g mol}^{-1}$**

#### Answer

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

% of iron by mass = 69.9 % [Given]

% of oxygen by mass = 30.1 % [Given]

Atomic mass of iron = 55.85 amu

Atomic mass of oxygen = 16.00 amu

Relative moles of iron in iron oxide = %mass of iron by mass/Atomic mass of iron =  $69.9/55.85 = 1.25$

Relative moles of oxygen in iron oxide = %mass of oxygen by mass/Atomic mass of oxygen =  $30.01/16=1.88$

Simplest molar ratio =  $1.25/1.25 : 1.88/1.25$

$\Rightarrow 1 : 1.5 = 2 : 3$

$\therefore$  The empirical formula of the iron oxide is  $\text{Fe}_2\text{O}_3$ .

Mass of  $\text{Fe}_2\text{O}_3 = (2 \times 55.85) + (3 \times 16.00) = 159.7 \text{ g mol}^{-1}$

$n = \text{Molar mass}/\text{Empirical formula mass} = 159.7/159.6 = 1(\text{approx})$

Thus, Molecular formula is same as Empirical Formula i.e.  $\text{Fe}_2\text{O}_3$ .

NCERT 11th Chemistry Chapter 1, class 11 Chemistry Chapter 1 solutions

**1.9. Calculate the atomic mass (average) of chlorine using the following data :**

	<b>% Natural Abundance</b>	<b>Molar Mass</b>
$^{35}\text{Cl}$	<b>75.77</b>	<b>34.9689</b>
$^{37}\text{Cl}$	<b>24.23</b>	<b>36.9659</b>

**Answer**

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

Fractional Abundance of  $^{35}\text{Cl}$  = 0.7577 and Molar mass = 34.9689

Fractional Abundance of  $^{37}\text{Cl}$  = 0.2423 and Molar mass = 36.9659

$$\begin{aligned}\therefore \text{Average Atomic mass} &= (0.7577 \times 34.9689) \text{amu} + (0.2423 \times 36.9659) \\ &= 26.4959 + 8.9568 = 35.4527\end{aligned}$$

**1.10. In three moles of ethane ( $\text{C}_2\text{H}_6$ ), calculate the following :**

**(i) Number of moles of carbon atoms.**

**(ii) Number of moles of hydrogen atoms.**

**(iii) Number of molecules of ethane.**

**Answer**

(i) 1 mole of  $\text{C}_2\text{H}_6$  contains 2 moles of Carbon atoms

$\therefore$  3 moles of  $\text{C}_2\text{H}_6$  will contain 6 moles of Carbon atoms

(ii) 1 mole of  $\text{C}_2\text{H}_6$  contains 6 moles of Hydrogen atoms

$\therefore$  3 moles of  $\text{C}_2\text{H}_6$  will contain 18 moles of Hydrogen atoms

(iii) 1 mole of  $\text{C}_2\text{H}_6$  contains Avogadro's no.  $6.02 \times 10^{23}$  molecules

$\therefore$  3 moles of  $\text{C}_2\text{H}_6$  will contain ethane molecule =  $3 \times 6.02 \times 10^{23} = 18.06 \times 10^{23}$  molecules.

**1.11. What is the concentration of sugar ( $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ ) in  $\text{mol L}^{-1}$  if its 20 g are dissolved in**

**enough water to make a final volume up to 2L?**

**Answer**

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basics-concepts/>

Molar mass of sugar ( $C_{12}H_{22}O_{11}$ ) =  $(12 \times 12) + (1 \times 22) + (11 \times 16) = 342 \text{ g mol}^{-1}$

No. of moles in 20g of sugar =  $20/342 = 0.0585 \text{ mole}$

Volume of Solution = 2L (given)

Molar concentration = Moles of solute/Volume of solution in L =  
 $0.0585 \text{ mol}/2\text{L} = 0.0293 \text{ mol L}^{-1} = 0.0293 \text{ M}$

**1.12. If the density of methanol is  $0.793 \text{ kg L}^{-1}$ , what is its volume needed for making 2.5 L of its 0.25 M solution?**

**Answer**

Molar mass of methanol ( $CH_3OH$ ) =  $(1 \times 12) + (4 \times 1) + (1 \times 16) = 32 \text{ g mol}^{-1} = 0.032 \text{ kg mol}^{-1}$

Molarity of the solution =  $0.793/0.032 = 24.78 \text{ mol L}^{-1}$

Applying,  $M_1V_1$  (Given Solution) =  $M_2V_2$  (Solution to be prepared)

$$24.78 \times V_1 = 0.25 \times 2.5 \text{ L}$$

$$V_1 = 0.02522 \text{ L} = 25.22 \text{ mL}$$

**1.13. Pressure is determined as force per unit area of the surface. The SI unit of pressure, pascal is as shown below :**

$$1\text{Pa} = 1\text{N m}^{-2}$$

**If mass of air at sea level is  $1034 \text{ g cm}^{-2}$ , calculate the pressure in pascal.**

**Answer**

Pressure is the force (i.e. weigh) acting per unit area.

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basics-concepts/>

$$P = F/A = 1034\text{g} \times 9.8\text{ms}^{-2} / \text{cm}^2$$
$$= 1034\text{g} \times 9.8\text{ms}^{-2} / \text{cm}^2 \times 1\text{kg}/1000\text{g} \times 100\text{cm}/1\text{m} \times 100\text{cm}/1\text{m} = 1.01332 \times 10^5 \text{ N}$$

Now,

$$1\text{Pa} = 1\text{N m}^{-2}$$

$$\therefore 1.01332 \times 10^5 \text{ N} \times \text{m}^{-2} = 1.01332 \times 10^5 \text{ Pa}$$

NCERT 11th Chemistry Chapter 1

### 1.14. What is the SI unit of mass? How is it defined?

#### Answer

The SI unit of mass is kilogram (kg).

The kg is defined as the mass of platinum-iridium (Pt-Ir) cylinder that is stored in an air-tight jar at International Bureau of Weigh and Measures in France.

### 1.15. Match the following prefixes with their multiples:

Prefixes	Multiples
(i) micro	$10^6$
(ii) deca	$10^9$
(iii) mega	$10^{-6}$
(iv) giga	$10^{-15}$
(v) femto	10

#### Answer

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basics-concepts/>

Prefixes	Multiples
(i) micro	$10^{-6}$
(ii) deca	10
(iii) mega	$10^6$
(iv) giga	$10^9$
(v) femto	$10^{-15}$

NCERT 11th Chemistry Chapter 1, class 11 Chemistry Chapter 1 solutions

### 1.16. What do you mean by significant figures ?

#### Answer

Significant figures are meaningful digits which are known with certainty including the last digit whose value is uncertain.

For example,

In 11.2546 g, there are 6 significant figures but here 11.254 is certain and 6 is uncertain and the uncertainty would be  $\pm 1$  in the last digit. Hence last uncertain digit is also included in Significant figures.

**1.17. A sample of drinking water was found to be severely contaminated with chloroform,  $\text{CHCl}_3$ , supposed to be carcinogenic in nature. The level of contamination was 15 ppm (by mass).**

**(i) Express this in percent by mass.**

**(ii) Determine the molality of chloroform in the water sample.**

#### Answer

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

(i) 15 ppm means 5 parts in million( $10^6$ ) parts.

$$\therefore \% \text{ by mass} = 15/10^6 \times 100 = 15 \times 10^{-4} = 1.5 \times 10^{-3} \%$$

(ii) Molar mass of chloroform( $\text{CHCl}_3$ ) =  $12+1+(3 \times 35.5) = 118.5 \text{ g mol}^{-1}$

100g of the sample contain chloroform =  $1.5 \times 10^{-3} \text{g}$

$$\therefore 1000 \text{ g}(1 \text{ kg}) \text{ of the sample will contain chloroform} = 1.5 \times 10^{-2} \text{ g}$$

$$= 1.5 \times 10^{-2} / 118.65 \text{ mole} = 1.266 \times 10^{-4} \text{ mole}$$

$$\therefore \text{Molality} = 1.266 \times 10^{-4} \text{ m.}$$

NCERT 11th Chemistry Chapter 1, class 11 Chemistry Chapter 1 solutions

### 1.18. Express the following in the scientific notation:

(i) 0.0048

(ii) 234,000

(iii) 8008

(iv) 500.0

(v) 6.0012

**Answer**

$$(i) 0.0048 = 4.8 \times 10^{-3}$$

$$(ii) 234,000 = 2.34 \times 10^5$$

$$(iii) 8008 = 8.008 \times 10^3$$

$$(iv) 500.0 = 5.000 \times 10^2$$

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

(v)  $6.0012 = 6.0012 \times 10^0$

**1.19. How many significant figures are present in the following?**

**(i) 0.0025**

**(ii) 208**

**(iii) 5005**

**(iv) 126,000**

**(v) 500.0**

**(vi) 2.0034**

**Answer**

(i) 2

(ii) 3

(iii) 4

(iv) 3

(v) 4

(vi) 5

**1.20. Round up the following upto three significant figures:**

**(i) 34.216**

**(ii) 10.4107**

**(iii) 0.04597**

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

**(iv) 2808**

**Answer**

(i) 34.2

(ii) 10.4

(iii) 0.046

(iv) 2810

**1.21. The following data are obtained when dinitrogen and dioxygen react together to form different compounds:**

	<b>Mass of dinitrogen</b>	<b>Mass of dioxygen</b>
<b>(i)</b>	<b>14 g</b>	<b>16 g</b>
<b>(ii)</b>	<b>14 g</b>	<b>32 g</b>
<b>(iii)</b>	<b>28 g</b>	<b>32 g</b>
<b>(iv)</b>	<b>28 g</b>	<b>80 g</b>

**(a) Which law of chemical combination is obeyed by the above experimental data? Give its statement.**

**(b) Fill in the blanks in the following conversions:**

**(i) 1 km = ..... mm = ..... pm**

**(ii) 1 mg = ..... kg = ..... ng**

**(iii) 1 mL = ..... L = ..... dm<sup>3</sup>**

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

## Answer

(a) Fixing the mass of dinitrogen as 28 g, masses of dioxygen combined will be 32, 64, 32 and 80 g in the given four oxides. These masses of dioxygen bears a simple whole number ratio as 2:4:2:5. Hence, the data given will obey the law of multiple proportions.

The statement is as follows two elements always combine in a fixed mass of other bearing a simple ratio to another to form two or more chemical compounds.

$$(b) (i) 1 \text{ km} = 1\text{km} \times 1000\text{m} / 1\text{km} \times 100\text{cm} / 1\text{m} / 10\text{mm} / 1\text{cm} = 10^6 \text{ mm}$$

$$1 \text{ km} = 1\text{km} \times 1000\text{m} / 1\text{km} \times 1\text{pm} / 10^{-12}\text{m} = 10^{15} \text{ pm}$$

$$(ii) 1 \text{ mg} = 1\text{mg} \times 1\text{g} / 1000\text{mg} \times 1\text{kg} / 1000\text{g} = 10^{-6} \text{ kg}$$

$$1 \text{ mg} = 1\text{mg} \times 1\text{g} / 1000\text{mg} \times 1\text{ng} / 10^{-9}\text{g} = 10^{-6} \text{ ng}$$

$$(iii) 1 \text{ mL} = 1\text{mL} \times 1\text{L} / 1000\text{mL} = 10^{-3} \text{ L}$$

$$1 \text{ mL} = 1\text{cm}^3 = 1\text{cm}^3 \times (1\text{dm} \times 1\text{dm} \times 1\text{dm} / 10\text{cm} \times 10\text{cm} \times 10\text{cm}) = 10^3 \text{ dm}^3$$

NCERT 11th Chemistry Chapter 1

**1.22. If the speed of light is  $3.0 \times 10^8 \text{ ms}^{-1}$ , calculate the distance covered by light in 2.00 ns.**

## Answer

$$\begin{aligned} \text{Distance covered} &= \text{Speed} \times \text{Time} = 3.0 \times 10^8 \text{ ms}^{-1} \times 2.00 \text{ ns} \\ &= 3.0 \times 10^8 \text{ ms}^{-1} \times 2.00 \text{ ns} \times 10^{-9} \text{ s} / 1 \text{ ns} = 6.00 \times 10^{-1} \text{ m} = 0.600 \text{ m} \end{aligned}$$

**1.23. In a reaction**

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

**Identify the limiting reagent, if any, in the following reaction mixtures.**

**(i) 300 atoms of A + 200 molecules of B**

**(ii) 2 mol A + 3 mol B**

**(iii) 100 atoms of A + 100 molecules of B**

**(iv) 5 mol A + 2.5 mol B**

**(v) 2.5 mol A + 5 mol B**

**Answer**

(i) According to the reaction, 1 atom of A reacts with 1 molecule of B.

$\therefore$  200 molecules of B will react with 200 atoms of A, thereby leaving 100 atoms of A unreacted. Hence, B is the limiting reagent.

(ii) According to the reaction, 1 mol of A reacts with 1 mol of B.

$\therefore$  2 mol of A will react with only 2 mol of B leaving 1 mol of B. Hence, A is the limiting reagent.

(iii) 1 atom of A combines with 1 molecule of B.

$\therefore$  All 100 atoms of A will combine with all 100 molecules of B. Hence, the mixture is stoichiometric and there is no limiting reagent.

(iv) 1 mol of atom A combines with 1 mol of molecule B.

$\therefore$  2.5 mol of B will combine with only 2.5 mol of A. and 2.5 mol of A will be left unreacted. Hence, B is the limiting reagent.

(v) 1 mol of atom A combines with 1 mol of molecule B.

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

∴ 2.5 mol of A will combine with only 2.5 mol of B and the remaining 2.5 mol of B will be left. Hence, A is the limiting reagent.

**1.24. Dinitrogen and dihydrogen react with each other to produce ammonia according to the following chemical equation:**

**(i) Calculate the mass of ammonia produced if  $2.00 \times 10^3 \text{g}$  dinitrogen reacts with  $1.00 \times 10^3 \text{g}$  of dihydrogen.**

**(ii) Will any of the two reactants remain unreacted?**

**(iii) If yes, which one and what would be its mass?**

**Answer**

1 mole of dinitrogen (28g) reacts with 3 mole of dihydrogen (6g) to give 2 mole of ammonia (34g).

∴ 2000 g of  $\text{N}_2$  will react with  $\text{H}_2 = 6/28 \times 2000 = 428.6 \text{g}$ . Thus, here  $\text{N}_2$  is the limiting reagent while  $\text{H}_2$  is in excess.

28g of  $\text{N}_2$  produce 34g of  $\text{NH}_3$ .

∴ 2000g of  $\text{N}_2$  will produce =  $34/28 \times 2000 \text{g} = 2428.57 \text{g}$  of  $\text{NH}_3$ .

(ii)  $\text{N}_2$  is the limiting reagent and  $\text{H}_2$  is the excess reagent. Hence,  $\text{H}_2$  will remain unreacted.

(iii) Mass of dihydrogen left unreacted =  $1000 \text{g} - 428.6 \text{g} = 571.4 \text{g}$

**1.25. How are 0.50 mol  $\text{Na}_2\text{CO}_3$  and 0.50 M  $\text{Na}_2\text{CO}_3$  different?**

**Answer**

Molar mass of  $\text{Na}_2\text{CO}_3 = (2 \times 23) + 12.00 + (3 \times 16) = 106 \text{ g mol}^{-1}$

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basics-concepts/>

$\therefore 0.50 \text{ mol Na}_2\text{CO}_3 \text{ means } 0.50 \times 106 \text{ g} = 53 \text{ g}$

0.50 M  $\text{Na}_2\text{CO}_3$  means 0.50 mol of  $\text{Na}_2\text{CO}_3$  i.e. 53g of  $\text{Na}_2\text{CO}_3$  are present in 1 litre of the solution.

**1.26. If ten volumes of dihydrogen gas reacts with five volumes of dioxygen gas, how many volumes of water vapour would be produced?**

**Answer**

Dihydrogen gas reacts with dioxygen gas as,

Thus, two volumes of dihydrogen react with one volume of dioxygen to produce two volumes of water vapour. Hence, ten volumes of dihydrogen will react with five volumes of dioxygen to produce ten volumes of water vapour.

**1.27. Convert the following into basic units:**

**(i) 28.7 pm**

**(ii) 15.15 pm**

**(iii) 25365 mg**

**Answer**

(i)  $1 \text{ pm} = 10^{-12} \text{ m}$

$$28.7 \text{ pm} = 28.7 \times 10^{-12} \text{ m} = 2.87 \times 10^{-11} \text{ m}$$

(ii)  $1 \text{ pm} = 10^{-12} \text{ m}$

$$\therefore 15.15 \text{ pm} = 15.15 \times 10^{-12} \text{ m} = 1.515 \times 10^{-11} \text{ m}$$

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

(iii)  $1 \text{ mg} = 10^{-3} \text{ g}$

$25365 \text{ mg} = 2.5365 \times 10^4 \times 10^{-3} \text{ g}$

Now,

$1 \text{ g} = 10^{-3} \text{ kg}$

$2.5365 \times 10 \text{ g} = 2.5365 \times 10 \times 10^{-3} \text{ kg}$

$\therefore 25365 \text{ mg} = 2.5365 \times 10^{-2} \text{ kg}$

**1.28. Which one of the following will have largest number of atoms?**

**(i) 1 g Au (s)**

**(ii) 1 g Na (s)**

**(iii) 1 g Li (s)**

**(iv) 1 g of  $\text{Cl}_2$  (g)**

**Answer**

(i)  $1 \text{ g Au} = 1/197 \text{ mol} = 1/197 \times 6.022 \times 10^{23} \text{ atoms}$

(ii)  $1 \text{ g Na} = 1/23 \text{ mol} = 1/23 \times 6.022 \times 10^{23} \text{ atoms}$

(iii)  $1 \text{ g Li} = 1/7 \text{ mol} = 1/7 \times 6.022 \times 10^{23} \text{ atoms}$

(iv)  $1 \text{ g Cl}_2 = 1/71 \text{ mol} = 1/71 \times 6.022 \times 10^{23} \text{ atoms}$

Thus, 1 g of Li has the largest number of atoms.

**1.29. Calculate the molarity of a solution of ethanol in water in which the mole fraction of ethanol is 0.040 (assume the density of water to be one).**

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basic-concepts/>

## Answer

Mole fraction of  $C_2H_5OH = \text{No. of moles of } C_2H_5OH / \text{No. of moles of solution}$

$$n_{C_2H_5OH} = n(C_2H_5OH) / (C_2H_5OH) + n(H_2O) = 0.040 \text{ (Given) ... 1}$$

We have to find the number of moles of ethanol in 1L of the solution but the solution is dilute. Therefore, water is approx. 1L.

$$\text{No. of moles in 1L of water} = 1000\text{g} / 18\text{g mol}^{-1} = 55.55 \text{ moles}$$

Substituting  $n(H_2O) = 55.55$  in equation 1

$$n(C_2H_5OH) / (C_2H_5OH) + 55.55 = 0.040$$

$$\Rightarrow 0.96n(C_2H_5OH) = 55.55 \times 0.040$$

$$\Rightarrow n(C_2H_5OH) = 2.31 \text{ mol}$$

Hence, molarity of the solution = 2.31M

### 1.30. What will be the mass of one $^{12}C$ atom in g ?

## Answer

$$1 \text{ mol of } ^{12}C \text{ atoms} = 6.022 \times 10^{23} \text{ atoms} = 12\text{g}$$

$$\therefore \text{Mass of 1 atom } ^{12}C = 12 / 6.022 \times 10^{23} \text{ g} = 1.9927 \times 10^{-23} \text{ g}$$

### 1.31. How many significant figures should be present in the answer of the following calculations?

(i)  $0.02856 \times 298.15 \times 0.112 / 0.5785$

(ii)  $5 \times 5.364$

(iii)  $0.0125 + 0.7864 + 0.0215$

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basics-concepts/>

### Answer

(i) Least precise term i.e. 0.112 is having 3 significant digits.

∴ There will be 3 significant figures in the calculation.

(ii) 5.364 is having 4 significant figures.

∴ There will be 4 significant figures in the calculation.

(iii) Least number of decimal places in each term is 4.

∴ There will be 4 significant figures in the calculation.

**1.32. Use the data given in the following table to calculate the molar mass of naturally occurring argon isotopes:**

Isotope	Isotopic molar mass	Abundance
$^{36}\text{Ar}$	35.96755 g mol <sup>-1</sup>	0.337%
$^{38}\text{Ar}$	37.96272 g mol <sup>-1</sup>	0.063%
$^{40}\text{Ar}$	39.9624 g mol <sup>-1</sup>	99.600%

### Answer

Molar mass of Ar =  $\sum p_i A_i$

$$= (0.00337 \times 35.96755) + (0.00063 \times 37.96272) + (0.99600 \times 39.9624) = 39.948 \text{ g mol}^{-1}$$

**1.33. Calculate the number of atoms in each of the following**

**(i) 52 moles of Ar (ii) 52 u of He (iii) 52 g of He.**

### Answer

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basics-concepts/>

(i) 1 mol of Ar =  $6.022 \times 10^{23}$  atoms

$\therefore$  52 mol of Ar =  $52 \times 6.022 \times 10^{23}$  atoms =  $3.131 \times 10^{25}$  atoms

(ii) 1 atom of He = 4 u of He

4 u of He = 1 Atom of He

$\therefore$  52 u of He =  $1/4 \times 52 = 13$  atoms

(iii) 1 mol of He = 4 g =  $6.022 \times 10^{23}$  atoms

$\therefore$  52 g of He =  $(6.022 \times 10^{23}/4) \times 52$  atoms =  $7.8286 \times 10^{24}$  atoms

**1.34. A welding fuel gas contains carbon and hydrogen only. Burning a small sample of it in oxygen gives 3.38 g carbon dioxide, 0.690 g of water and no other products. A volume of 10.0 L (measured at STP) of this welding gas is found to weigh 11.6 g. Calculate (i) empirical formula, (ii) molar mass of the gas, and (iii) molecular formula.**

**Answer**

Amount of carbon in 3.38 g of  $\text{CO}_2 = 12/44 \times 3.38 \text{ g} = 0.9218 \text{ g}$

Amount of hydrogen in 0.690 g  $\text{H}_2\text{O} = 2/18 \times 0.690 \text{ g} = 0.0767 \text{ g}$

The compound contains only C and H, therefore total mass of the compound =  $0.9218 + 0.0767 = 0.9985 \text{ g}$

% of C in the compound =  $(0.9218/0.9985) \times 100 = 92.32$

% of H in the compound =  $(0.0767/0.9985) \times 100 = 7.68$

(i) Calculation of empirical formula,

Moles of carbon in the compound =  $92.32/12 = 7.69$

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basics-concepts/>

Moles of hydrogen in the compound =  $7.68/1 = 7.68$

Simplest molar ratio =  $7.69 : 7.68 = 1(\text{approx})$

∴ Empirical formula CH

(ii) 10.0 L of the gas at STP weigh = 11.6 g

∴ 22.4 L of the gas at STP =  $11.6/10.0 \times 22.4 = 25.984 = 26$  (approx)

∴ Molar mass of gass =  $26 \text{ g mol}^{-1}$

(iii) Mass of empirical formula CH =  $12+1 = 13$

∴  $n = \text{Molecular Mass}/\text{Empirical Formula} = 26/13 = 2$

∴ Molecular Formula =  $\text{C}_2\text{H}_2$

**1.35. Calcium carbonate reacts with aqueous HCl to give  $\text{CaCl}_2$  and  $\text{CO}_2$  according to the reaction,  $\text{CaCO}_3(\text{s}) + 2\text{HCl}(\text{aq}) \rightarrow \text{CaCl}_2(\text{aq}) + \text{CO}_2(\text{g}) + \text{H}_2\text{O}(\text{l})$**

**What mass of  $\text{CaCO}_3$  is required to react completely with 25 mL of 0.75 M HCl?**

**Answer**

1000 mL of 0.75 M HCl have 0.75 mol of HCl =  $0.75 \times 36.5 \text{ g} = 24.375 \text{ g}$

∴ Mass of HCl in 25mL of 0.75 M HCl =  $24.375/1000 \times 25 \text{ g} = 0.6844 \text{ g}$

From the given chemical equation,

2 mol of HCl i.e. 73 g HCl react completely with 1 mol of  $\text{CaCO}_3$  i.e. 100g

<https://www.indcareer.com/schools/ncert-solutions-for-11th-class-chemistry-chapter-1-some-basi-c-concepts/>

$\therefore 0.6844 \text{ g HCl reacts completely with CaCO}_3 = 100/73 \times 0.6844 \text{ g} = 0.938 \text{ g}$

**1.36. Chlorine is prepared in the laboratory by treating manganese dioxide (MnO<sub>2</sub>) with aqueous hydrochloric acid according to the reaction**

**How many grams of HCl react with 5.0 g of manganese dioxide?**

**Answer**

1 mol of MnO<sub>2</sub> = 55+32 g = 87 g

87 g of MnO<sub>2</sub> react with 4 moles of HCl i.e. 4×36.5 g = 146 g of HCl.

$\therefore 5.0 \text{ g of MnO}_2 \text{ will react with HCl} = 146/87 \times 5.0 \text{ g} = 8.40 \text{ g}.$

NCERT 11th Chemistry Chapter 1, class 11 Chemistry Chapter 1 solutions

# About NCERT

The National Council of Educational Research and Training is an autonomous organization of the Government of India which was established in 1961 as a literary, scientific, and charitable Society under the Societies Registration Act. The major objectives of NCERT and its constituent units are to: undertake, promote and coordinate research in areas related to school education; prepare and publish model textbooks, supplementary material, newsletters, journals and develop educational kits, multimedia digital materials, etc.

Organise pre-service and in-service training of teachers; develop and disseminate innovative educational techniques and practices; collaborate and network with state educational departments, universities, NGOs and other educational institutions; act as a clearing house for ideas and information in matters related to school education; and act as a nodal agency for achieving the goals of Universalisation of Elementary Education.

Its headquarters are located at Sri Aurobindo Marg in New Delhi.
