NCERT Solutions for 9th Class Science : Chapter 5 The Fundamental Unit of Life

Class 9: Science Chapter 5 solutions. Complete Class 9 Science Chapter 5 Notes.

NCERT Solutions for 9th Class Science : Chapter 5 The Fundamental Unit of Life

NCERT 9th Science Chapter 5, class 9 Science Chapter 5 solutions

Page No: 59

1. Who discovered cells and how?

<https://www.indcareer.com/schools/ncert-solutions-for-9th-class-science-chapter-5-the-fundamental-unit-of-life/>

Answer

An English Botanist, Robert Hooke discovered cells. In 1665, he used self-designed microscope to observe cells in a cork slice.

2. Why is the cell called the structural and functional unit of life?**Answer**

Cells are called the structural and functional unit of life because all the living organisms are made up of cells and also all the functions taking place inside the body of organisms are performed by cells.

NCERT 9th Science Chapter 5, class 9 Science Chapter 5 solutions

1. How do substances like CO₂ and water move in and out of the cell? Discuss.**Answer**

The substances like CO₂ and water move in and out of a cell by diffusion from the region of high concentration to low concentration.

When the concentration of CO₂ and water is higher in external environment than that inside the cell, CO₂ and water moves inside the cell. When the concentration outside the cell becomes low and it is high inside the cell, they moves out.

2. Why is the plasma membrane called a selectively permeable membrane?**Answer**

Plasma membrane called a selectively permeable membrane because it regulates the movement of substances in and out of the cell. This means that the plasma membrane allows the entry of only some substances and prevents the movement of some other materials.

1. Fill in the gaps in the following table illustrating differences between prokaryotic and eukaryotic cells.

Prokaryotic cell	Eukaryotic cell
1 Size: generally small (1-10 μm) 1 $\mu\text{m} = 10^{-6}$ m	1 Size: generally large (5-100 μm)
2 Nuclear region: _____ and is known as _____.	2 Nuclear region: well-defined and surrounded by a nuclear membrane
3 Chromosome: single	3 More than one chromosome
4 Membrane-bound cell organelles are absent	4 _____

Answer

Prokaryotic cell	Eukaryotic cell
1 Size: generally small (1-10 μm) 1 $\mu\text{m} = 10^{-6}$ m	1 Size: generally large (5-100 μm)
2 Nuclear region: poorly defined because of the absence of a nuclear membrane, and is known as nucleoid	2 Nuclear region: well-defined and surrounded by a nuclear membrane
3 Chromosome: single	3 More than one chromosome

|---|---|---|--|
| 4 | Membrane-bound cell organelles are absent | 4 | Membrane-bound cell organelles such as mitochondria, plastids, etc., are present |
|---|---|---|--|

Page No: 65

1. Can you name the two organelles we have studied that contain their own genetic material?

Answer

Mitochondria and plastids

2. If the organisation of a cell is destroyed due to some physical or chemical influence, what will happen?

Answer

If the organisation of a cell is destroyed due to some physical or chemical influence then cell will not be able to perform the basic functions like respiration, nutrition, excretion etc. This may stop all the life activities and may result in its death.

3. Why are lysosomes known as suicide bags?

Answer

Lysosomes are called suicide bags because in case of disturbance of their cellular metabolism they digest their own cell by releasing own enzymes.

4. Where are proteins synthesized inside the cell?

Answer

The proteins are synthesized in the Ribosome inside the cell.

1. Make a comparison and write down ways in which plant cells are different from animal cells.

Answer

Animal cell	Plant cell
They do not have a cell wall.	They have a cell wall made up of cellulose.
They do not have chloroplast.	They contain chloroplast.
They have centrosome.	They do not have centrosome.
Vacuoles are smaller in size.	Vacuoles are larger in size.
Lysosomes are larger in number.	Lysosomes are absent or very few in number
Prominent Golgi bodies are present.	Subunits of Golgi bodies known as dictyosomes are present.

2. How is a prokaryotic cell different from a eukaryotic cell?

Answer

Prokaryotic cell	Eukaryotic cell
Most prokaryotes are unicellular.	Most eukaryotes are multicellular.
Size of the cell is generally small (0.5- 5 μm).	Size of the cell is generally large (50- 100 μm).

<https://www.indcareer.com/schools/ncert-solutions-for-9th-class-science-chapter-5-the-fundamental-unit-of-life/>

Nuclear region is poorly defined due to the absence of a nuclear membrane or the cell lacks true nucleus.

It contains a single chromosome.

Nucleolus is absent.

Membrane-bound cell organelles such as plastids, mitochondria, endoplasmic reticulum, Golgi apparatus, etc. are absent.

Cell division occurs through binary fission

Prokaryotic cells are found in bacteria and blue-green algae.

Nuclear region is well-defined and is surrounded by a nuclear membrane, or true nucleus bound by a nuclear membrane is present in the cell.

It contains more than one chromosome.

Nucleolus is present.

Cell organelles such as mitochondria, plastids, endoplasmic reticulum, Golgi apparatus, lysosomes, etc. are present.

Cell division occurs by mitosis.

Eukaryotic cells are found in fungi, plants, and animal cells.

3. What would happen if the plasma membrane ruptures or breaks down?

Answer

If the plasma membrane ruptures or breakdown then the cell will not be able to exchange material from its surrounding by diffusion or osmosis. Thereafter the protoplasmic material will be disappeared and the cell will die.

Page No: 67

4. What would happen to the life of a cell if there was no Golgi apparatus?

Answer

Golgi apparatus has the function of storage modification and packaging of the products. If there is no Golgi apparatus then the packaging and transporting of materials synthesized by cell will not happen.

5. Which organelle is known as the powerhouse of the cell? Why?

Answer

Mitochondria are known as the powerhouse of cells because energy required for various chemical activities needed for life is released by mitochondria in the form of ATP (Adenosine triphosphate) molecules.

6. Where do the lipids and proteins constituting the cell membrane get synthesized?

Answer

Lipids are synthesized in Smooth endoplasmic reticulum (SER) and the proteins are synthesized in rough endoplasmic reticulum (RER).

7. How does an Amoeba obtain its food?

Answer

Amoeba takes in food using temporary finger-like extensions of the cell surface which fuse over the food particle forming a food-vacuole as shown in figure. Inside the food vacuole, complex substances are broken down into simpler ones which then diffuse into the cytoplasm. The remaining undigested material is moved to the surface of the cell and thrown out.

8. What is osmosis?

Answer

Osmosis is the process in which water molecules moves from the region of high concentration to a region of low concentration through a semi permeable membrane.

9. Carry out the following osmosis experiment:

Take four peeled potato halves and scoop each one out to make potato cups. One of these potato cups should be made from a boiled potato. Put each potato cup in a trough containing water. Now,

- Keep cup A empty
- Put one teaspoon sugar in cup B
- Put one teaspoon salt in cup C
- Put one teaspoon sugar in the boiled potato cup D.

<https://www.indcareer.com/schools/ncert-solutions-for-9th-class-science-chapter-5-the-fundamental-unit-of-life/>

Keep these for two hours. Then observe the four potato cups and answer the following:

- (i) Explain why water gathers in the hollowed portion of B and C.
- (ii) Why is potato A necessary for this experiment?
- (iii) Explain why water does not gather in the hollowed out portions of A and D.

Answer

(i) Water gathers in the hollowed portions of set-up B and C because water enters the potato as a result of osmosis. Since the medium surrounding the cell has a higher water concentration than the cell, the water moves inside by osmosis. Hence, water gathers in the hollowed portions of the potato cup.

(ii) Potato A in the experiment acts as a control set-up. No water gathers in the hollowed portions of potato A.

(iii) Water does not gather in the hollowed portions of potato A because potato cup A is empty. It is a control set-up in the experiment.

Water is not able to enter potato D because the potato used here is boiled. Boiling denatures the proteins present in the cell membrane and thus, disrupts the cell membrane. For osmosis, a semi-permeable membrane is required, which is disrupted in this case. Therefore, osmosis will not occur. Hence, water does not enter the boiled potato cup.

NCERT 9th Science Chapter 5, class 9 Science Chapter 5 solutions

<https://www.indcareer.com/schools/ncert-solutions-for-9th-class-science-chapter-5-the-fundamental-unit-of-life/>

Chapterwise NCERT Solutions for Class 9 Science :

- Chapter 1 Matter in Our Surroundings
- Chapter 2 Is Matter Around Us Pure
- Chapter 3 Atoms And Molecules
- Chapter 4 Structure Of The Atom
- Chapter 5 The Fundamental Unit Of Life
- Chapter 6 Tissues
- Chapter 7 Diversity in Living Organisms
- Chapter 8 Motion
- Chapter 9 Force And Laws Of Motion
- Chapter 10 Gravitation
- Chapter 11 Work and Energy
- Chapter 12 Sound
- Chapter 13 Why Do We Fall ill
- Chapter 14 Natural Resources
- Chapter 15 Improvement in Food Resources

About NCERT

The National Council of Educational Research and Training is an autonomous organization of the Government of India which was established in 1961 as a literary, scientific, and charitable Society under the Societies Registration Act. The major objectives of NCERT and its constituent units are to: undertake, promote and coordinate research in areas related to school education; prepare and publish model textbooks, supplementary material, newsletters, journals and develop educational kits, multimedia digital materials, etc. Organise pre-service and in-service training of teachers; develop and disseminate innovative educational techniques and practices; collaborate and network with state educational departments, universities, NGOs and other educational institutions; act as a clearing house for ideas and information in matters related to school education; and act as a nodal agency for achieving the goals of Universalisation of Elementary Education. In addition to research, development, training, extension, publication and dissemination activities, NCERT is an implementation agency for bilateral cultural exchange programmes with other countries in the field of school education. Its headquarters are located at Sri Aurobindo Marg in New Delhi. [Visit the Official NCERT website](#) to learn more.
